

AI ENTERPRISE SALES DIAGNOSTIC

# Revenue Architecture for AI Platform Companies

Kombra Group • kombragroup.com • hello@kombragroup.com

THE PROBLEM

Enterprise AI sales stall between the demo and the contract. The technology is good. The buyer is interested. But somewhere between interest and signature, momentum dies. The causes vary — value translation, ICP drift, competitive framing, motion inconsistency, feedback latency — but they share a common trait: they are system problems, not people problems. A structured diagnostic identifies which ones are active and builds the framework to resolve them.

WHAT I'VE SEEN

The pattern that creates friction in enterprise AI sales is different in every organization. What's consistent is that it's identifiable in 4-6 weeks if you know what to look for. In 20 years of enterprise technology work, I've observed five recurring failure patterns: value translation gaps, ICP drift, competitive framing as feature comparison, sales motion inconsistency, and slow feedback loops. The diagnostic finds which ones are active. The playbook resolves them.

FIVE PATTERNS THE DIAGNOSTIC TESTS

| Pattern                                   | What it looks like                                                                                                       |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| AI value translation gap                  | Product positioned as "AI-first" but buyer needs CFO-grade economics. Conceptual AI stories fail procurement scorecards. |
| ICP drift                                 | Broad targeting without enforced segmentation. Pipeline inflates. Conversion drops.                                      |
| Competitive framing as feature comparison | Feature comparisons favor incumbents with 20 years of development. Displacement requires an economic argument.           |
| Sales motion inconsistency                | Without standardized discovery and demo choreography, every rep tells a different story.                                 |
| Slow feedback loops                       | Win/loss insights take months to reach the people who can act on them. The system can't learn.                           |

THE ENGAGEMENT

Six weeks. \$40,000. Sixteen deliverables.

|          |                                                                                                                  |
|----------|------------------------------------------------------------------------------------------------------------------|
| Week 1–2 | Sales motion diagnostic. Rep interviews. Collateral audit. Friction map — where deals die and why.               |
| Week 3–4 | Revenue architecture blueprint. Discovery question bank (100+ questions). Demo choreography. ICP scoring matrix. |
| Week 5   | 8 competitive battlecards. 5 buyer persona profiles with objection matrices. AI-native sales process map.        |
| Week 6   | 3-hour team enablement session. 90-day execution plan. Measurement dashboard. Hiring recommendation.             |

ROI: 4 reps × \$2M quota = \$8M target. +10pp win rate = \$2.76M incremental ARR. Investment: \$40K. Conservative return: 69:1.

ALTERNATIVE ENTRY: DEAL ACCELERATION SPRINT

Pick 2-3 live deals. Two weeks. \$10,000–\$15,000. The diagnostic applied to real pipeline. If the lift is there, we scope the full engagement.
